DEPLOYMENT STANDARDS

Deployment

This page describes techniques for deploying your Angular application to a remote server.

Simplest deployment possible

For the simplest deployment, build for development and copy the output directory to a web server.

- 1. Start with the development build

```
ng build
```

- 2. Copy *everything* within the output folder (`dist/` by default) to a folder on the server.
- 3. If you copy the files into a server *sub-folder*, append the build flag, `--base-href` and set the

`<base href>` appropriately.

For example, if the `index.html` is on the server at `/my/app/index.html`, set the *base href* to

 **Deployment**

- Simplest deployment possible
- Optimize for production
 - Build with `--prod`
 - Enable production mode
 - Lazy loading
 - Measure performance
 - Inspect the bundles
- The base tag
- build* vs. *serve*
- Server configuration
 - Routed apps must fallback to `index.html`
 - Requesting services from a different server

<https://angular.io/guide/deployment>

Deployment

`npm run build` creates a `build` directory with a production build of your app. Set up your favorite HTTP server so that a visitor to your site is served `index.html`, and requests to static paths like `/static/js/main.<hash>.js` are served with the contents of the `/static/js/main.<hash>.js` file.

Static Server

For environments using [Node](#), the easiest way to handle this would be to install [serve](#) and let it handle the rest:

```
npm install -g serve
serve -s build
```

The last command shown above will serve your static site on the port `5000`. Like many of [serve](#)'s internal settings, the port can be adjusted using the `-p` or `--port` flags.

Run this command to get a full list of the options available:

```
serve -h
```

Production Deployment

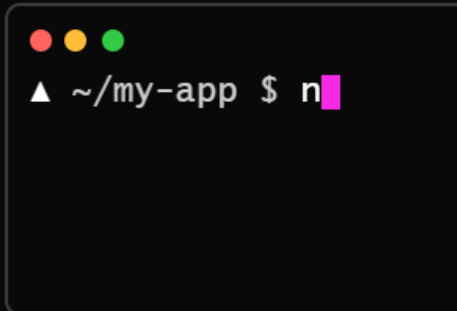

Turn on Production Mode

During development, Vue provides a lot of warnings to help you with common errors and pitfalls. However, these warning strings become useless in production and bloat your app's payload size. In addition, some of these warning checks have small runtime costs that can be avoided in production mode.

Without Build Tools

easier for CD

PITFALLS

learning curve
working in the command line
overkill

GOOGLE CLOUD REACT.JS

Deploying a containerized web application

[SEND FEEDBACK](#)

This tutorial shows you how to package a web application in a Docker container image, and run that container image on a Google Kubernetes Engine cluster as a load-balanced set of replicas that can scale to the needs of your users.

Objectives

To package and deploy your application on GKE, you must:

1. Package your app into a Docker image
2. Run the container locally on your machine (optional)
3. Upload the image to a registry
4. Create a container cluster
5. Deploy your app to the cluster
6. Expose your app to the Internet
7. Scale up your deployment

Amazon S3

Object storage built to store and retrieve any amount of data from anywhere

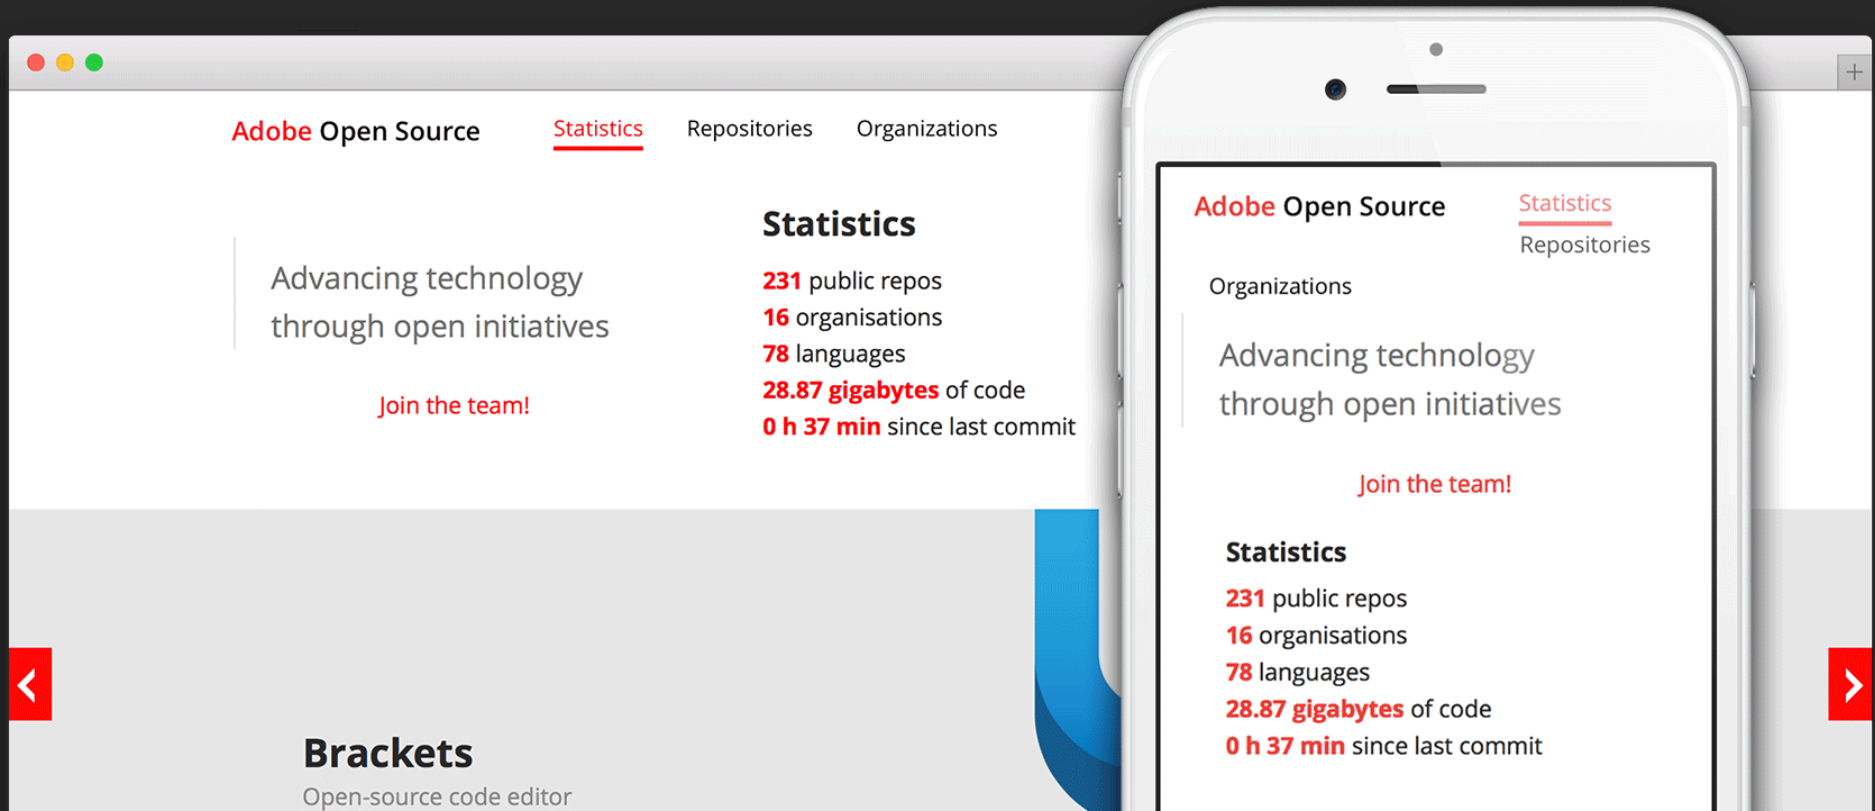

[Get started with Amazon S3](#)[Request more information](#)

Companies today need the ability to simply and securely collect, store, and analyze their data at a massive scale. Amazon S3 is [object storage](#) built to store and retrieve any amount of data from anywhere – web sites and mobile apps, corporate applications, and data from IoT sensors or devices. It is designed to deliver 99.999999999% durability, and stores data for millions of applications used by market leaders in every industry. S3 provides comprehensive security and compliance capabilities that meet even the most stringent regulatory requirements. It gives customers flexibility in the way they manage data for cost optimization, access control, and compliance. S3 provides query-in-place functionality, allowing you to run powerful analytics directly on your data at rest in S3. And Amazon S3 is the most supported cloud storage service available, with integration from the largest community of third-party solutions, systems integrator partners, and other AWS services.

Websites for you and your projects.

Hosted directly from your [GitHub repository](#). Just edit, push, and your changes are live.

Firebase helps mobile app teams succeed.
