## Strategies to make web apps more engaging, more reliable and more fast

Using modern web technologies like push and cache APIs.

You add JavaScript and json files to your project to add capabilities like push notifications, offline caching, fullscreen views and more.

#### Service Worker API

Service Worker guides Using Service Workers

Service workers essentially act as proxy servers that sit between web applications, and the browser and the network (when available). They are intended to (amongst other things) enable the creation of effective offline experiences, intercepting network requests, and taking appropriate action based on whether the network is available, and updated assets reside on the server. They will also allow access to push notifications and background sync APIs.

Interfaces

@T7MANICS

### serviceworker.js

```
if ('serviceWorker' in navigator && 'PushManager' in window) {
  console.log('Service Worker and Push is supported');
  navigator.serviceWorker.register('sw.js')
  .then(function(swReg) {
    console.log('Service Worker is registered', swReg);
    swRegistration = swReg;
  })
  .catch(function(error) {
    console.error('Service Worker Error', error);
 });
} else {
  console.warn('Push messaging is not supported');
  pushButton.textContent = 'Push Not Supported';
```

### Web App Manifest

Jump to: Deploying a manifest Example manifest Members Splash screens

Mime type Specification Browser compatibility

The web app manifest provides information about an application (such as name, author, icon, and description) in a JSON text file. The purpose of the manifest is to install web applications to the homescreen of a device, providing users with quicker access and a richer experience.

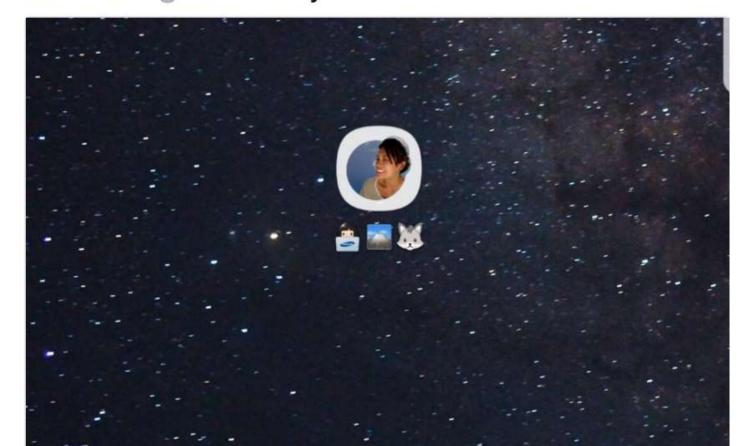

Web app manifests are part of a collection of web technologies called progressive web apps, which are web applications that can be installed to the homescreen of a device without needing the user to go through an app store, along with other capabilities such as being available offline and receiving push notifications.

@TZMANICS

```
manifest.json
"name": "pwa-ftw",
"short_name": "PWA-FTWR,
"icons": [
   "src": "/static/ima/icons/android-chrome-192x192.pna",
   "sizes": "192<u>x192</u>",
   "type": "image/png"
   "src": "/static/ima/icons/android-chrome-512x512.pna",
   "sizes": "512<u>x512</u>",
    "type": "image/png"
"start<u>url</u>": "/index.html",
"display": "standalone",
"background_color": "#000000",
"theme_color": "#4DBA87"
```

I am always strongly advocating for emoji use in your #pwa app manifest. Come on, who doesn't want to 
that adorable #toshmagosh emoji?!?
